

1 **ABSTRACT**

2 Systems and methods are described for declarative localization of web
3 services. A "localize" attribute is described that uniquely identifies localized
4 content for the final rendered element. The "localize" attribute is stripped out
5 during the rendering process, so it never reaches the client or agent, making the
6 "localize" attribute HTML-compliant. A separate satellite assembly is maintained
7 for each culture. When a request is received, a culture is identified and the
8 "localize" attribute directs processing to utilize content maintained in the satellite
9 assembly associated with the identified culture. Processing then continues
10 normally.
